

SUMMARY

- 5 The invention concerns a device (1) for measuring and/or testing of components of optical and/or electrical networks, with a casing (2) and an optical and/or electrical connection jack (5) attached to the casing (2), to which an optical and/or electrical lead (8) can be connected directly or indirectly via an adapter (9), wherein a lift device (11) is provided, with which the connection jack (5) can be
- 10 moved relative to the casing (2) between a lifted position and a lowered position.
